

CS415 Compilers

Syntax Analysis Part 4

These slides are based on slides copyrighted by
Keith Cooper, Ken Kennedy & Linda Torczon at Rice
University

Roadmap for the remainder of the course

- Fourth homework:
Due Monday, March 28
- Project #2 - Bottom-up parser and compiler
Will be posted next week, due April 13 (tentative)
- Project #3 - Peephole optimizer for ILOC
Will be posted April 13, due May 2 (tentative)
- Second midterm on Wednesday, April 6 (60 minutes in class)
- Final exam on May 10 (60 minutes at assigned location)
- At least 3 more homeworks

Bottom-up Parsing (Syntax Analysis)

EAC Chapters 3.4

LL(1), recursive descent

1 input symbol lookahead
 construct leftmost derivation (forwards)
 input: read left-to-right

$$S \Rightarrow_{lm}^* x A \beta \Rightarrow_{lm} x \delta \beta \Rightarrow_{lm}^* x y$$

? Means that we don't know yet this part of the parse tree

LR(1), operator precedence

1 input symbol lookahead
 construct rightmost derivation (backwards)
 input: read left-to-right

$$S \Rightarrow_{rm}^* \alpha B y \Rightarrow_{rm} \alpha \gamma y \Rightarrow_{rm}^* x y$$

handle
 rule $B ::= \gamma$

? Means that we
 don't know yet this
 part of the parse tree

LR(1), operator precedence

1 input symbol lookahead
construct rightmost derivation (backwards)
input: read left-to-right

$$S \Rightarrow^*_{rm} \alpha \textcircled{B} y \Rightarrow_{rm} \alpha \textcircled{\gamma} y \Rightarrow^*_{rm} x y$$

rule $B ::= \gamma$

? Means that we don't know yet this part of the parse tree

Is the following grammar LL(1), L(2), or LR(1)?

$$S ::= a b \mid a b c$$

Is the following grammar LR(1) or even LR(0)?

$$S ::= a S b \mid c$$

Basic idea:

shift symbols from input onto the stack until top of the stack is a RHS of a rule; if so, "apply" rule backwards (reduce) by replacing top of the stack by the LHS non-terminal.

Challenge: When to shift, and when to reduce

Consider the simple grammar

1	Goal	→	<u>a</u> A B <u>e</u>
2	A	→	A <u>b</u> <u>c</u>
3			<u>b</u>
4	B	→	<u>d</u>

And the input string abbcde

Sentential Form	Next Reduction	
	Prod'n	Pos'n
<u>abbcde</u>	3	2
<u>a</u> A <u>bcde</u>	2	4
<u>a</u> A <u>de</u>	4	3
<u>a</u> A B <u>e</u>	1	4
Goal	—	—

The trick is scanning the input and finding the next reduction

The mechanism for doing this must be efficient

The parser must find a substring β of the tree's frontier that *matches some production $A \rightarrow \beta$ that occurs as one step in the rightmost derivation*

Informally, we call this substring β a *handle*

Formally,

A *handle* of a right-sentential form γ is a pair $\langle A \rightarrow \beta, k \rangle$ where $A \rightarrow \beta \in P$ and k is the position in γ of β 's rightmost symbol.

If $\langle A \rightarrow \beta, k \rangle$ is a handle, then replacing β at k with A produces the right sentential form from which γ is derived in the rightmost derivation.

Because γ is a right-sentential form, the substring to the right of a handle contains *only terminal symbols*

- \Rightarrow the parser doesn't need to scan past the handle (only lookahead)
- \Rightarrow The right end of the handle will be on top of the stack, not within the stack. Need lookahead to determine whether we reached the handle.

Critical Insight

(Theorem)

*If G is unambiguous, then every right-sentential form has a **unique** handle.*

If we can find those handles, we can build a derivation !

Sketch of Proof:

- 1 G is unambiguous \Rightarrow rightmost derivation is unique
- 2 \Rightarrow a unique production $A \rightarrow \beta$ applied to derive γ_i from γ_{i-1}
- 3 \Rightarrow a unique position k at which $A \rightarrow \beta$ is applied
- 4 \Rightarrow a unique handle $\langle A \rightarrow \beta, k \rangle$

This all follows from the definitions

Consider the simple grammar

1	Goal	→	<u>a</u> A B <u>e</u>
2	A	→	A <u>b</u> <u>c</u>
3			<u>b</u>
4	B	→	<u>d</u>

And the input string abbcde

Sentential Form	Next Reduction	
	Prod'n	Pos'n
<u>abbcd</u> e	3	2
<u>a</u> A <u>bcde</u>	2	4
<u>a</u> A <u>d</u> e	4	3
<u>a</u> A B <u>e</u>	1	4
Goal	—	—

The trick is scanning the input and finding the next reduction

The mechanism for doing this must be efficient

RUTGERS LR(0) items and LR(0) canonical collection

$S_0: \{[Goal \rightarrow \cdot a A B e]\}$

$S_1: \{[Goal \rightarrow a \cdot A B e], [A \rightarrow \cdot A b c], [A \rightarrow \cdot b]\}$

$S_2: \{[Goal \rightarrow a A \cdot B e], [A \rightarrow A \cdot b c], [B \rightarrow \cdot d]\}$

$S_3: \{[A \rightarrow b \cdot]\}$

$S_4: \{[Goal \rightarrow a A B \cdot e]\}$

$S_5: \{[A \rightarrow A b \cdot c]\}$

$S_6: \{[B \rightarrow d \cdot]\}$

$S_7: \{[A \rightarrow A b c \cdot]\}$

$S_8: \{[Goal \rightarrow a A B e \cdot]\}$

			<i>Prod'n.</i>	<i>Sentential Form</i>	<i>Handle</i>	
1	<i>Goal</i>	→	<i>Expr</i>	—	<i>Goal</i>	—
2	<i>Expr</i>	→	<i>Expr + Term</i>	1	<i>Expr</i>	1,1
3			<i>Expr - Term</i>	3	<i>Expr - Term</i>	3,3
4			<i>Term</i>	5	<i>Expr -Term* Factor</i>	5,5
5		→	<i>Term * Factor</i>	9	<i>Expr - Term* <id,y></i>	9,5
6	<i>Term</i>		<i>Term / Factor</i>	7	<i>Expr - Factor* <id,y></i>	7,3
7			<i>Factor</i>	8	<i>Expr - <num,2>* <id,y></i>	8,3
8		→	<u>number</u>	4	<i>Term- <num,2>* <id,y></i>	4,1
9			<u>id</u>	7	<i>Factor - <num,2>* <id,y></i>	7,1
10	<i>Factor</i>		<i>(Expr)</i>	9	<i><id,x>- <num,2>* <id,y></i>	9,1

The expression grammar

Handles for rightmost derivation of $x - 2 * y$

The process of discovering a handle & reducing it to the appropriate left-hand side is called *handle pruning*

Handle pruning forms the basis for a bottom-up parsing method

To construct a rightmost derivation

$$S \Rightarrow \gamma_0 \Rightarrow \gamma_1 \Rightarrow \gamma_2 \Rightarrow \dots \Rightarrow \gamma_{n-1} \Rightarrow \gamma_n \Rightarrow w$$

Apply the following simple algorithm

for $i \leftarrow n$ to 1 by -1

Find the handle $\langle A_i \rightarrow \beta_i, k_i \rangle$ in γ_i

Replace β_i with A_i to generate γ_{i-1}

This takes $2n$ steps

One implementation technique is the *shift-reduce parser*

```
push INVALID // bottom of stack marker
token ← next_token( )
repeat until (top of stack = Goal and token = EOF)
  if the top of the stack is a handle  $A \rightarrow \beta$ 
    then // reduce  $\beta$  to  $A$ 
      pop  $|\beta|$  symbols off the stack
      push  $A$  onto the stack
  else if (token  $\neq$  EOF)
    then // shift
      push token
      token ← next_token( )
  else // need to shift, but out of input
    report an error
```

How do errors show up?

- failure to find a handle
- hitting EOF & needing to shift (final else clause)

Either generates an error

Stack	Input	Handle	Action
\$	<u>id</u> = num * <u>id</u>	<i>none</i>	shift
\$ <u>id</u>	= num * <u>id</u>		

1. Shift until the top of the stack is the right end of a handle
2. Find the left end of the handle & reduce

```
stack.push(INVALID); stack.push( $s_0$ );
not_found = true;
token = scanner.next_token();
do while (not_found) {
    s = stack.top();
    if ( ACTION[s,token] == "reduce  $A \rightarrow \beta$ " ) then {
        stack.popnum( $2 * |\beta|$ ); // pop  $2 * |\beta|$  symbols
        s = stack.top();
        stack.push( $A$ );
        stack.push(GOTO[s, $A$ ]);
    }
    else if ( ACTION[s,token] == "shift  $s$ " ) then {
        stack.push(token); stack.push( $s$ );
        token ← scanner.next_token();
    }
    else if ( ACTION[s,token] == "accept"
              & token == EOF )
        then not_found = false;
    else report a syntax error and recover;
}
report success;
```

The skeleton parser

- uses ACTION & GOTO tables
- does $|words|$ shifts
- does $|derivation|$ reductions
- does 1 accept
